Laravel

PERSONAL PROJECTS

Development of Transformer Health Monitoring System

- We have designed a real time monitoring and protection system of transformer.
- It can minimize the possible faults normally occurring in the real life transformer used in power distribution . In this Sensor are used to sense the main parameters of equipment such as voltage, current and temperature.
- The LCD display and the corresponding parameters value can be monitored on the mobile application. Immediately the signal is sent to the circuit consisting of relay which detects the fault and trips the circuit at that moment to protect from any further damage.
- The transformer is protected from possible faults and an alert signal is sent to operator when the parameters exceed safe limits enabling authorities to take preventive measures before any catastrophic failure.

Online Payment Form

- Website to display online Payment form.
- Frontend - HTML, CSS.
