PROJECT:

GSM Based Plant Irrigation System

This project's main motto is increasing of farming level. It is developed by using GSM(Global System For Mobile Communications) based communication.

Generally, now a days we are living in the embedded world and we are all busy with our daily activities by these life style the farming level is gradually decreasing. For increasing of farming level, we choose this project. For coming to the implementation take an Arduino board for giving of input output connections and for implementation of program to operate the motor. Provide a sim to the GSM Module for passing messages and for activating of system. The working process is firstly we call to the provided sim then the system will be activated then sensor is sensing the soil moisture content if it is low then it will send message like 'dry soil is detected' then we send message for motor on that is whatever we provide in the implemented program for motor on message that message will be send to that. If the sensor is detected wet soil then it will send message like 'wet soil is detected' then we don't need to motor on. If the motor will on to send the message for motor off. By these projects we save the Water and save the time.

TECHNICAL SKILLS:
