Projects

Driver Drowsiness Detection

Driver Drowsiness Detection System is currently, the system can detect only the slightly .tilted face of the driver. So, we are looking for an approach to easily detect tilted faces so that the application can be practically used. This system only looks at the number of consecutive frames
where the eyes are closed. At that point, it may be too late to issue the warning. By studying eye movement patterns, it is possible to find a method to generate the warning sooner.

Achievements & Awards

R programming (Great Learning)

Tensorflow (Infosys SpringBoard)

Zuno Fellowship (Monster)
